

Mailing List Health Report

Prepared June 5, 2026. Database snapshot captured at 15:45 coordinated universal time. The report expands the mailing list summary into portfolio, campaign, engagement, and operational views.

Executive Summary

- **The portfolio expanded by 20,370 net addresses today.** The new family office, high net worth, and Limited Partner Pipeline lists increase net list capacity from 191,315 to 211,685 members. The new family office list is the meaningful scale addition; the other two are smaller, higher-touch audiences.
- **The program is still highly concentrated in Amols202604.** That one list has 185,757 net members, or 87.8% of the current net portfolio. That concentration is useful for reach but makes deliverability, queue safety, and unsubscribe hygiene disproportionately dependent on one asset.
- **Delivery mechanics are mostly working, but the active queue needs attention.** The live queue snapshot shows 182,368 succeeded rows, no failed rows, only 3 dead rows, and 81,699 pending rows. The low dead count is good; the open pending and processing work is the immediate operational risk.
- **Engagement tracking exists, but attribution is incomplete.** The provider event log contains delivered, opened, clicked, bounced, and delayed events, including 236 unique recipients with opens and 30 unique recipients with clicks. Most stored events do not carry a campaign identifier, so performance can be read directionally but not yet as reliable per-campaign conversion.

The mailing list base is much bigger, but one list still carries the program

The current list portfolio has eight lists. The new imports added meaningful segmentation, but Amols202604 remains the dominant reach engine. For planning, treat the new lists as segment-specific channels rather than a replacement for the main list.

Net mailing list size by list

Net size equals total stored members minus unsubscribed members.

The chart is intentionally scaled to show the imbalance. The key implication is operational: mistakes, deliverability issues, or quota limits on Amols202604 will dominate the overall program until the smaller lists either grow or are used for distinct high-value outreach.

Full list inventory

Mailing list	Total size	Unsubscribed	Net size	Unsubscribe rate
Amol's Test List	4	0	4	0.00%
Amols202604	186,146	389	185,757	0.21%
Amols five thousand	5,000	116	4,884	2.32%
humanswhoreply	157	1	156	0.64%
AmolsParis	517	3	514	0.58%
Family Offices 2026 06 05	18,233	0	18,233	0.00%
High Net Worth Amols Friends 2026 06 05	383	0	383	0.00%
Limited Partner Pipeline 2026 06 05	1,754	0	1,754	0.00%

The new imports are clean enough to use, with different jobs

The three new lists were created from Affinity exports dated June 5, 2026. The family office file is a broad reach asset. The high net worth friends file is small and personal. The Limited Partner Pipeline file creates multiple recipients from some opportunity rows, so its unique-address count is larger than the number of opportunity rows.

Imported source rows and unique usable email addresses

Shows how much usable recipient coverage each source file produced.

Source list	Rows in file	Rows with a recipient	Unique email addresses	Duplicate email occurrences
Family Offices 2026 06 05	20,897	18,298	18,233	65
High Net Worth Amols Friends 2026 06 05	387	385	383	2
Limited Partner Pipeline 2026 06 05	1,258	1,162	1,754	97

Interpretation. The family office export had the largest amount of missing contact detail, but still produced 18,233 usable unique addresses. The Limited Partner Pipeline export has the most duplication because one opportunity can repeat people across relationships; deduplication kept the final list clean.

Geography coverage in the new lists

New list	Largest country segments
Family Offices	United States (12,430), Canada (1,091), United Kingdom (708), Germany (172)
High Net Worth Amols Friends	United States (254), United Kingdom (24), Switzerland (9), Germany (8)
Limited Partner Pipeline	No country metadata available

Recent sends show reach, but completion is uneven

The recent mailing history has three distinct patterns: complete test or small-list sends, a large canceled send, and a large live LifeX send that still had pending and processing rows at the snapshot time. This is the most important operational readout because it says whether list capacity is turning into completed outreach.

Recent mailing outcome rows

Each bar counts recipient-level queue rows for a mailing and list.

Succeeded Pending or processing Canceled Dead

LifeX is the current focus. The LifeX mailing on Amols202604 had 110,185 succeeded rows and 75,683 rows still pending or processing at the snapshot. That means the send was about 59.3% complete by recipient rows, excluding any unavailable canceled count for that one campaign.

The old May 7 send is correctly treated as a past incident, not a live campaign. It sent 63,553 recipients before cancellation and left 122,592 canceled rows. The operational lesson is that large sends need explicit release windows, quota checks, and a scoped monitor before anyone opens a worker.

List	Mailing	Date	Succeeded	Pending or processing	Canceled	Dead
Amols202604	LifeX is getting loud: exits, Lon...	May 31, 2026	110,185	75,683	Not available	1
Amols202604	NY: birthday + LifeX Fund 2	May 7, 2026	63,553	0	122,592	1
Amols202604	London and NY: join me (birthday)	April 21, 2026	146	0	0	0
Amols 5k	NY: you survived + LifeX Fund 2	May 11, 2026	0	4,884	116	0
Amols 5k	come to my birthday next week //...	May 2, 2026	5,000	0	0	0
AmolsParis	Paris this week: founders meetup...	May 31, 2026	516	0	1	0
Amol's Test List	Alive in Tokyo: a funeral, an app...	May 30, 2026	4	0	0	0

Latest mailing history by list

This table keeps the operational lookup together: each mailing list, its current net size, and the latest three mailing records available from the queue history. Lists created today have no mailing history yet.

Mailing list	Net size	Latest mailing records
Amol's Test List	4	May 30, 2026: Alive in Tokyo: a funeral, an app store, and two ne... (4 succeeded, 0 pending or processing) May 6, 2026: NY: birthday + LifeX Fund 2 (4 succeeded, 0 pending or processing) April 30, 2026: NY: birthday + LifeX Fund 2 (4 succeeded, 0 pending or processing)
Amols202604	185,757	May 31, 2026: LifeX is getting loud: exits, London, and useful li... (110,185 succeeded, 75,683 pending or processing) May 7, 2026: NY: birthday + LifeX Fund 2 (63,553 succeeded, 0 pending or processing) April 21, 2026: London and NY: join me (birthday) (146 succeeded, 0 pending or processing)
Amols five thousand	4,884	May 11, 2026: NY: you survived + LifeX Fund 2 (0 succeeded, 4,884 pending or processing) May 2, 2026: come to my birthday next week // may 9 (5,000 succeeded, 0 pending or processing)
humanswhoreply	156	No queued or sent mailings found.
AmolsParis	514	May 31, 2026: Paris this week: founders meetup on Thursday (516 succeeded, 0 pending or processing)
Family Offices 2026 06 05	18,233	No queued or sent mailings found.
High Net Worth Amols Friends 2026 06 05	383	No queued or sent mailings found.
Limited Partner Pipeline 2026 06 05	1,754	No queued or sent mailings found.

The delivery system is successful at the row level, but queue hygiene is the blocker

Across the queue, failures are not the main problem. The system has no failed rows in the snapshot and only three dead rows. The main issue is unresolved work: pending and processing rows that still need to be deliberately drained, held, or canceled.

Current queue status

Point-in-time count of recipient-level queue rows.

Operational implication. The sender can work, but it needs a controlled run book. Before any new campaign goes out, the current pending rows should be reconciled against the intended campaign identifier, Amazon Simple Email Service quota headroom, and list scope. This is especially important because the queue was changing during this report snapshot.

Engagement exists, but campaign attribution needs repair

The provider event log shows recipients receiving, opening, and clicking. That is encouraging because the system is capturing downstream behavior. However, most provider events lack an email identifier, so the data cannot yet answer which specific campaign, subject, or list is driving engagement.

Provider events by unique recipient

Overall event log only; most events cannot be tied back to a campaign.

Event type	Events	Unique recipients	What it tells you
Sent	404	403	Provider accepted the message event.
Delivered	334	333	Mailbox provider reported delivery.
Opened	244	236	Recipient loaded tracking content.
Clicked	146	30	Recipient clicked a tracked link.
Bounced	83	83	Mailbox rejected or could not accept delivery.
Delivery delayed	8	8	Provider reported a temporary delay.

Interpretation. Click behavior is concentrated: 146 click events came from 30 unique recipients. That suggests some recipients are highly engaged, but without campaign identifiers the next best action is instrumentation repair, not over-interpreting the click rate.

What this says about what you have been doing

You have moved from one broad personal list toward a segmented fundraising and investor-relations system. The new list names map to different jobs: family offices for institutional wealth reach, high net worth friends for warmer personal outreach, and Limited Partner Pipeline for active fundraising follow-up.

The mailing operation is becoming scale-constrained rather than list-constrained. You now have more than enough addresses to hit daily sending limits. The limiting factors are queue control, Amazon Simple Email Service quota, campaign attribution, and whether the right segment receives the right message at the right time.

The healthiest behavior so far is low hard failure. Dead and failed queue rows are tiny relative to succeeded sends. The riskiest behavior is unresolved queue state after large releases, because it blurs whether a campaign is still in progress, intentionally held, or accidentally active.

Recommended next steps

- **Finish or intentionally hold the LifeX queue before starting a new large send.** Use only the explicit campaign identifier and verify pending, processing, and quota headroom first.
- **Use the new lists as separate campaigns, not one merged blast.** Family offices, high net worth friends, and Limited Partner Pipeline contacts should get different framing, reply paths, and follow-up expectations.
- **Repair provider event attribution.** Make sure each provider event stores the campaign identifier or a reliable message-to-campaign mapping. Without that, opens and clicks cannot guide subject lines, audience selection, or follow-up priority.
- **Add a list-health review before each send.** Review net size, unsubscribed count, top domains, recent send history, and duplicate or recently contacted recipients before queue release.
- **Create a simple weekly operating report.** Track net list size, newly added addresses, sent rows, pending rows, dead rows, bounces, opens, clicks, and unsubscribes. The most useful trend will be movement week over week, not a one-time table.

Further questions

- Which segment produces the most replies, meetings, or commitments after email, not just clicks? That needs reply or customer relationship management data joined to mailing history.
- Should the family office list be warmed gradually before a full campaign? The list is large enough that a poor first message could create avoidable unsubscribes or reputation pressure.
- Are pending rows intended to be sent, held for quota pacing, or canceled? The answer changes whether the current system is healthy or stuck.
- Which contacts overlap across the new lists and Amols202604? This report deduplicates inside each new list, but cross-list overlap should be checked before sending similar messages.

Caveats, assumptions, and evidence notes

The report uses the live Supabase project as the database source and the three June 5, 2026 Affinity exports as the import source. The local evidence bundle is saved next to this report as report-data.json.

- The queue snapshot is point-in-time. Counts changed during live reads, so active queue numbers should be refreshed immediately before operational decisions.
- Provider event counts are directional because most stored events do not contain a campaign identifier. They prove that tracking exists, but they do not prove campaign-level performance.
- The old May 7 large campaign's succeeded count uses the checked-in operator status because the live exact-count query timed out for that status.
- Net size is defined here as total stored members minus unsubscribed members. It does not remove bounced addresses unless those addresses were also marked unsubscribed.
- The source files are Affinity exports. The report preserves their mailing list names, but expands Limited Partner in prose for readability.
